## ABSTRACT

The content of this paper is based on a development plan currently in design for the U.S. Navy in conjunction with the Learning Systems Institute at Florida State University. Leading research (literature review) references and case study ("best practice") references are presented as supporting evidence for the results-oriented distributed learning environment. The paper describes a conceptual model for a distributed learning environment, including linkages of performance requirements and appropriate learning theories and models. This conceptual model is embedded in a systems approach and reflects a learner-centered educational system. The emphasis is based on a results-oriented performance model for optimal required outcomes. The model is described in terms of a performance framework identified by both a needs assessment and needs analysis and comprised of four major subsystems (i.e., learner/performer support, course development, management, and learner/performer record), and the components of each subsystem, including key features and characteristics, functional requirements, and theoretical references. (Contains 21 references.) (Author/MES)

## ABSTRACT

The content of the paper is based on a development plan currently in design for the U.S. Navy in conjunction with a renown learning institute at a major state university. Leading research references (literature review) and case study ("best practice") references as supporting evidence for the results-oriented distributed learning environment will be presented.

The paper describes a conceptual model for a distributed learning environment, including linkages of performance requirements and appropriate learning theories and models. This conceptual model is embedded in a system approach and reflects a learner-centered educational system. The emphasis will be based on a results-oriented performance model for optimal required outcomes. The model will be described in terms of a performance framework identified by both a needs assessment and needs analysis and comprised of four major subsystems, and the components of each subsystem, including key features and characteristics, functional requirements, and theoretical references.

## DISTRIBUTED LEARNING

Kaufman (1995) describes distributed learning (distance learning) as the provision of valid and useful learning opportunities at a time and place convenient for the learner. At a basic level, distributed learning takes place when the learning facilitator and learner(s) are separated by physical distance. Technology (e.g., voice, video, graphics, and print) is used to bridge the separation. If identified as the most appropriate solution to a problem or opportunity, distributed learning programs can provide a wide range of learning opportunities. These programs can reach those disadvantaged by time limitations, distance, or physical disability, and update the knowledge base of workers at their places of employment (Willis, 1995). Distributed learning can often provide learning opportunities for those who could or would not otherwise avail themselves of further education or training.

## SYSTEMS APPROACH

A systems approach assumes and strives for interdependence among supportive subsystems within a socio-cultural system. Key characteristics of a functional system include the transformation of the organization along the "information – knowledge – understanding" continuum. Indicators of expected outcomes serve as feedback within this continuously improving environment (Ackoff, 1974). This approach recognizes that a distributed learning environment (DLE) is composed of a number of interrelated processes within the subsystems that cannot be influenced independently. A DLE model should give emphasis to the concurrent design of these interrelationships (Branson, 1990).

To develop a DLE, four major subsystems should initially be considered (Donald P. Ely, personal correspondence, April, 1999):

1. Learner/Performer Support Subsystem.
2. Course Development Subsystem.
3. Management Subsystem.
4. Learner/Performer Record Subsystem.

In addition to these four major subsystems, the success of such a distributed learning environment is dependent on communication and data linkages that allow for a useful as well as an open and timely flow of information among all subsystems and with the learner and learning facilities. Continuous improvement of the DLE is contingent upon the collection of performance evaluation data for decision-making and valid and useful modifications to the system.

### **PERFORMANCE SYSTEM PLANNING**

There is a practical method for identifying the expected impact of performance improvement solutions, distributed learning or otherwise. This method is Front-End Assessment and Alignment (FEAA)...often called “needs assessment” and is an integral part of strategic system planning (Kaufman, 1992, 1998).

By conducting a FEAA before investing resources in the preparation of specific courses in a distributed learning format, an organization will ensure that training and/or other performance interventions will provide useful results. Such results for a large, complex organization should include several linked levels of outcomes and payoffs, including on-the-job performance, organizational effectiveness, and societal impact. FEAA can benefit policy makers, course planners, and/or instructional designers by justifying their decisions in terms of the relative costs and value-added to involved stakeholders. In short, FEAA better ensures that the right solution or intervention (such as distributed learning, incentive systems, and performance support systems) is matched with the right performance problem, or the right opportunity.

The FEAA facilitates the identification of:

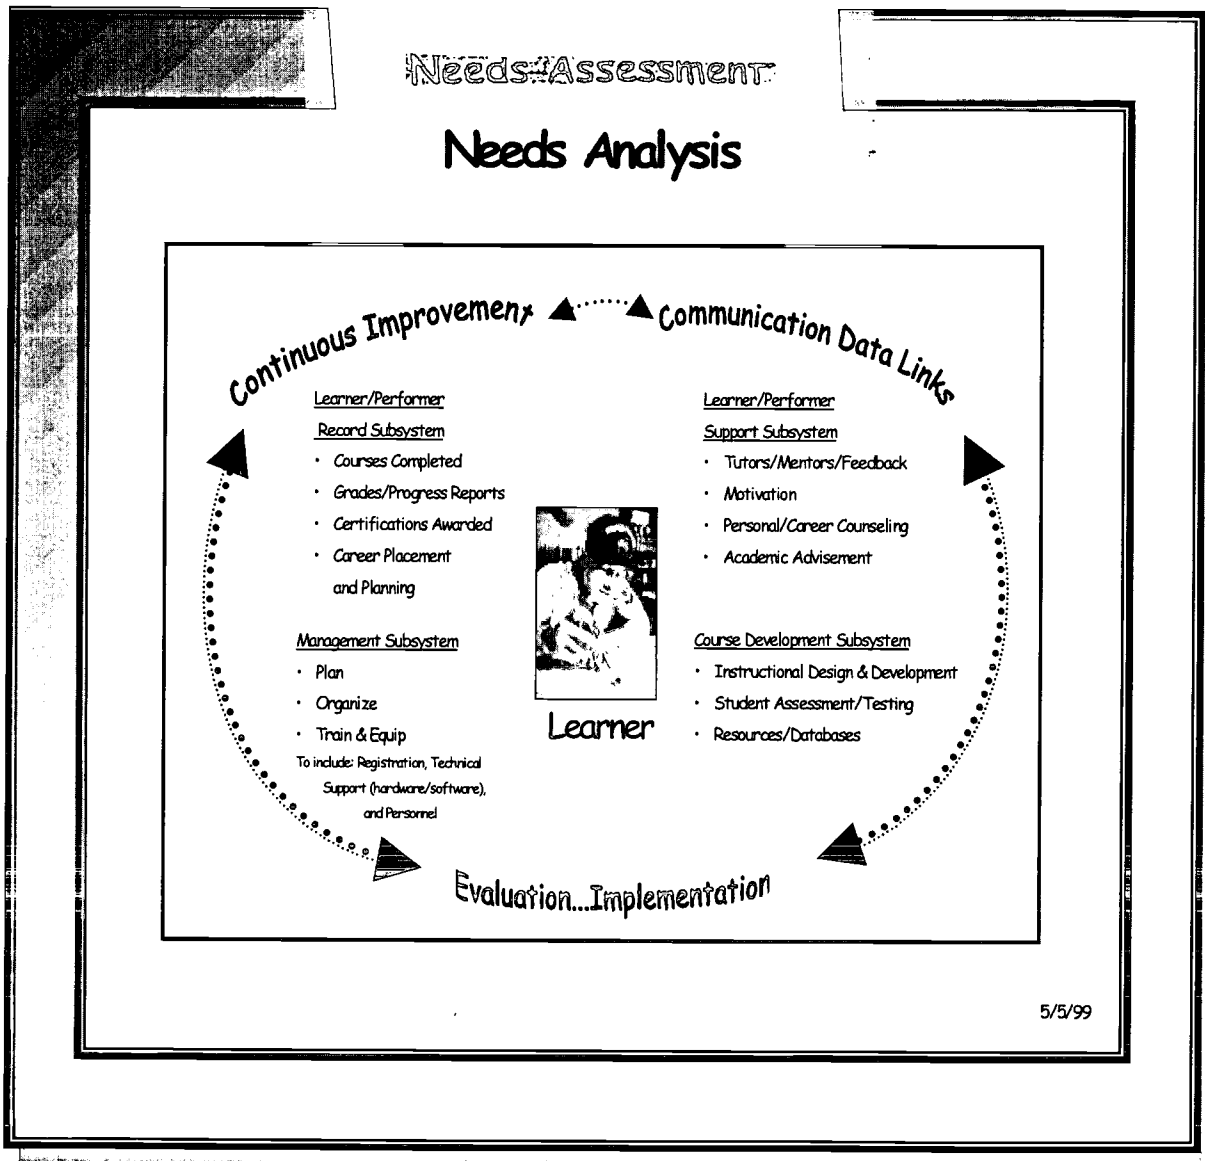

1. “What Is” vs. “What Should Be” -- in terms of organizational results and requirements measures.
2. Possible solutions, including training, to meet these performance requirements.
3. Feasibility studies/prototypes indicating performance requirements that can/cannot be met using a specific solution or mix of solutions.
4. Evaluation criteria to drive continuous improvement.

It should be noted that the Distributed Learning Environment (DLE) lies within a larger organizational performance framework. Both a needs assessment and needs analysis that may provide useful data and information by integrating characteristics of the four major subsystems and indicators of overall organizational readiness identify elements of the framework. These two processes are embedded throughout the DLE and are applied as appropriate. Figure 1 illustrates an organizational performance framework, DLE, and its related elements.

US Navy Performance Framework

Proposed Navy Advanced Distributed Learning Environment

A Learner-Centered Educational System

## INTRODUCTION TO TABLES 1-6

In our research efforts to date, this framework has been used as the basis for an extensive review of successful distributed learning programs. From the review, “best practices” were identified for each subsystem component and its major sub-components. The following set of tables more fully explores each of the major functional subsystems in the DLE. The Course Development subsystem is further broken down into some of the major phases of learning systems design (e.g., needs assessment, analysis and planning, and instructional systems design). Each subsystem is reviewed relative to Components, Key Features and Characteristics, Functional Requirements, and Theoretical References or Evidence to support the information in the table. These tables are designed to show the linkages between best practices found in the literature for distributed learning programs and the elements of an effective Navy Advanced Distributed Learning Environment (NADLE). Note that Functional Requirements is focused on the hardware, software, and electronic means to make each component happen.

### THE NEEDS ASSESSMENT ELEMENT OF SYSTEM PLANNING

The Needs Assessment (see Table 1) is the first step in improving decision-making and assuring that any intervention, including DL will meet the needs. Needs assessment is essential to useful planning because it assures that opportunities, purposes, and related solutions will be practical and results-oriented, not just process-oriented. It identifies and documents the gaps between current results and desired results, ideally those concerned with gaps in outcomes (fleet effectiveness and Navy valued added – or linked to them). The needs assessment arranges the gaps (needs) in order of priority and selects the needs to be resolved. Additionally, it provides criteria and other related information for continuous improvement. By correctly identifying real needs, before implementing any process or solution, organizations can improve their effectiveness and efficiency. The process can also help them reach ethical decisions by selecting the right job, so that doing the job correctly will be fruitful (Kaufman, 1992).

## THE NEEDS ANALYSIS ELEMENT OF SYSTEM PLANNING

The Needs Analysis (see Table 2) identifies the most effective and efficient ways and means to get the required results based on the causes for the needs. The needs analysis depends upon valid and prioritized needs and purposes which should have been previously identified during needs assessment. It then proceeds through various levels to determine all the requirements for successful problem resolution by identifying all aspects of the problem and setting detailed specifications for achieving organizational success. Each system analysis tool is results-oriented and identifies functions to be completed in order to meet needs. The tools may differ from others in degree, though not in kind, for they not only build on each other, but flow together.

### THE LEARNER/PERFORMER SUPPORT SUBSYSTEM

The Learner/Performer Support Subsystem (see Table 3) supports ongoing learning and development of learners. Many distant learners require support and guidance to make the most of their distributive learning (distance learning) experiences (Threlkeld & Brzoska, 1994). This support typically takes the form of some combination of learner-instructor, learner-learner, and learner-knowledge/data source interactions. This subsystem may also include support centers where learners complete tests (ideally, valid criterion-referenced tests based on documented needs), meet with tutors and other learners, and interact with various knowledge/data sources.

### THE COURSE DEVELOPMENT SUBSYSTEM

The Course Development Subsystem (see Table 4) is composed of interdisciplinary teams involving instructional/performance subsystem designers, content-matter experts, tutors, evaluators, and editors. It supports the needs assessment, needs analysis, planning, design, development, implementation and evaluation, and the use of performance data--especially properly acquired needs assessment data--for continuous improvement for both the learner and the performance system(s). In addition to these functions, decisions regarding delivery system selection, performance support requirements, course or program maintenance must be made and appropriate processes put in place.

### THE MANAGEMENT SUBSYSTEM

The Management Subsystem (see Table 5) is responsible for planning, organizing, and operating the learner-centered NADLE. An important function of this subsystem is to assure that valid and needs-related performance data/feedback are used to make modifications as required. At a more detailed level, this subsystem should address the issues of: learner registration, production and delivery, technical support (hardware and software), staff selection, training/development, and payroll/rewards, as well as the logistics behind ensuring deadlines are met and budgets balanced. Another aspect of this subsystem is the assurance that learning opportunities, learning vehicles, and learning materials are available, valid, and useful.

### THE LEARNER/PERFORMER RECORD SUBSYSTEM

The Learner/Performer Record Subsystem (see Table 6) tracks the activities of NADLE learners. It provides activity/accomplishment profiles for learners including, but not limited to, such data as courses attempted, courses completed grades and performance assessments, progress reports, and certifications awarded. Because individual performance is but one element in a successful system (Triner, Greenberry, & Watkins, 1996), payoffs for mastered performance abilities should also be tracked through the unit, fleet, and external value-added levels. This subsystem is critical in enabling learners to begin taking responsibility for their own learning. It helps learners gain an overview of what they have and have not completed and can guide their future development. The performance data collected in the subsystem will be useful for the continuous improvement of all other subsystems as well.

**Table 6. The Learner/Performer Record Subsystem.**

## ILLUSTRATION OF AN OPERATIONAL DISTRIBUTED LEARNING ENVIRONMENT

The following example illustrates the operation of the Distributed Learning Environment, which may be applied to any organizational setting.

### **Situation**

Big Software Maker of America has numerous offices and production facilities across the world. Much of their training and development activity is generated in the corporate office and offered to employees exclusively at regional training centers using live instructors as their primary delivery vehicle. The organization is considering how they can distribute this learning to more employees in a systematic way, allowing more flexibility in training, assessment, and certification location without greatly disrupting ongoing work structure and schedules. In addition, they are concerned with the high cost of travel associated with training.

### **Possible solution...**

Lets suppose, for instance, that a thorough needs assessment has identified a training program for first time managers, which we will call *First Level Management Training Program*, as a solution. The management subsystem would register all those employees eligible and available for the First Level Management Training Program, for instance.

This program is then systematically designed and developed by the course development subsystem. Following an instructional design model, they select CD-ROM as the primary delivery method, using the WWW as a supporting learning tool where they may access references and other additional course information. Trainees have the option of going through training at their present locations, be it office, home, or on the road, without having to travel to a regional training center, in turn reducing training cost to the organization. Should the trainees have any questions or difficulties, each has access to a tutor via telephone, email or in person at one of the local support centers if this is convenient to them.

The student record subsystem, meanwhile, would keep track of which employees are going through this training program at any given time as well as other training programs and/or courses they have previously completed. Consequently, trainees have access to progress reports and other information relating to their career development. All this data is of course shared through a common database accessible by all the subsystems.

## **IMPLEMENTATION/DIFFUSION**

This document should be used as a starting point for making decisions about the implementation of a DLE. It serves as a guide for selecting components to be included in a conceptualization of the possible components in this learning environment. It should be used along with organizational performance data to plan revisions to the operating environment and its respective subsystems. The use of front-end assessment and analysis would likely provide the designer/developer with information regarding relative effects, problems, and benefits within the whole system. The use of the FEAA process will require additional time from the developers. However, this is time well spent, as it will offer pre-implementation insight as to the value-added for the accomplishment of organizational performance, training and education goals.

The concurrent design process would include appropriate selection of technical support tools that will facilitate the necessary communication and data linkages. In addition, the selection of media (e.g., hardware, software, video, audio, and print) that function independently and interdependently with the DLE subsystems will be addressed. These data linkages will be designed and developed to support the evaluation, continuous improvement, and quality of the DLE.

The final system requirements and design specifications will be determined by organizational learners, instructors and course developers who identify what is working and what is not. Feedback data from rapid prototype designs will be used to make revisions and continuously improve the delivery of all training and education within the organization.

Although the effectiveness of technology in different distributed education applications and settings is currently under much research scrutiny, further study of the practical, social, and cultural implications of the use of technology in education/training is required (Bechky, 1999). The methods suggested in this paper should provide insight into the context and process of learning and could help shape distributed education/training programs in the future.

**REPRODUCTION RELEASE**  
(Specific Document)

**I. DOCUMENT IDENTIFICATION:**

Title: <i>Distributed Learning Environment: Major Functions, Implementation, and Continuous Improvement</i>	
Author(s): <i>Judith A. Converso, Scott P. Schaffer, Ingrid J. Guerra</i>	
Corporate Source: <i>Florida State University</i>	Publication Date: <i>10/20/99</i>

**II. REPRODUCTION RELEASE:**

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, *Resources in Education* (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic/optical media, and sold through the ERIC Document Reproduction Service (EDRS) or other ERIC vendors. Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce the identified document, please CHECK ONE of the following options and sign the release below.

Sample sticker to be affixed to document

Sample sticker to be affixed to document

INFORMATION CENTER (ERIC)"

**Level 2**

**or here**

Permitting  
reproduction  
in other than  
paper copy.

**Sign Here, Please**

Documents will be processed as indicated provided reproduction quality permits. If permission to reproduce is granted, but neither box is checked, documents will be processed at Level 1.

"I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce this document as indicated above. Reproduction from the ERIC microfiche or electronic/optical media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries."

Printed Name: <i>JUDITH A. CONVERSO</i>	Organization: <i>LEARNING SYSTEMS INSTITUTE</i>
Address: <i>Learning Systems Institute 4600 University Center Bldg C Tallahassee, FL 32306-2540</i>	Telephone Number: <i>(850) 645-0376</i>
	Date: <i>10/22/99</i>

### III. DOCUMENT AVAILABILITY INFORMATION (FROM NON-ERIC SOURCE):

If permission to reproduce is not granted to ERIC, or, if you wish ERIC to cite the availability of the document from another source, please provide the following information regarding the availability of the document. (ERIC will not announce a document unless it is publicly available, and a dependable source can be specified. Contributors should also be aware that ERIC selection criteria are significantly more stringent for documents that cannot be made available through EDRS.)
